PROFILE

Product-focused full-stack TypeScript engineer building workflow-heavy SaaS products where permissions, business state, data integrity and reliable delivery matter. Building web products since 2020, with a backend emphasis and end-to-end product ownership.

SELECTED PRODUCT ENGINEERING

Kadryn — AI cost management platform

Private B2B SaaS product focused on AI usage/cost signals, accountable decisions and reliable ingestion.

- Designed and implemented concurrent ingestion behavior with exact replay handling and quota correctness.
- Kept recommendation, human decision and runtime control as distinct product concepts.
- Built candidate-scoped verification with TypeScript, tests and release evidence; published a small public TypeScript reproduction of the core replay/quota invariant.

Travel orchestration SaaS

Private multi-tenant travel operations system where identity, authorization, durable async work and external-provider reconciliation remain explicit.

- Separated valid authentication sessions from current organization membership and business capability.
- Used server-side authority plus PostgreSQL/RLS as complementary access boundaries.
- Designed long-running provider work around leases, retries, dead-letter handling and explicit recovery paths.

Client delivery — Clé Solutions

Responsive service website for a Réunion locksmith, structured around local conversion, mobile-first delivery, service discovery and direct contact.

CORE ENGINEERING

Product systems

Multi-tenancy · permissions · workflow state · business rules

Backend & data

Node.js · PostgreSQL · Prisma · APIs · concurrency · RLS

Delivery & verification

Vitest · Playwright · Sentry · release evidence · regression tests

Product surface

React · Next.js · responsive UI · mobile/product states

STACK

TypeScript · Node.js · React · Next.js · PostgreSQL · Prisma · Supabase · Better Auth · Stripe · Inngest · Sentry · Vitest · Playwright

ENGINEERING APPROACH

Authority: keep identity, permissions and business capability explicit. **State:** model long-running work honestly.

Evidence: keep implementation claims proportional to what was actually verified.

AI-assisted, human-owned: use coding agents to accelerate exploration and implementation while architecture decisions, typed contracts, review, tests and release verification remain human-owned.

PUBLIC TECHNICAL EVIDENCE

github.com/WebNovation24/portfolio/tree/main/technical-evidence — small independently written TypeScript reproductions that make selected invariants inspectable without exposing private production source.
